No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 15,

Patent No. 6703018

GRNERAL INFORMATION:

APPLICANT: Presta, Leonard G.

TITLE OF INVENTION: Humanized Anti-CD11a Antibodies

NUMBER OF SEQUENCES: 24

CORRESPONDENCE ADDRESS:

STREET: 1 DNA Way

CITY: South San Francisco

STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              COMPUTER READABLE FORM:

MEDIUM TYPE: 3.5 inch, 1.44 Mb floppy disk

-!- MISCELLANEOUS: The second and third hypervariable regions of this chain are identical with those of the human POM V-III kappa chain, with which it shares certain idiotypic determinants.

-!- MISCELLANEOUS: This chain was isolated from an IgM with anti-gamma globulin activity.
                                                                                                                                                                                                                                       "Complete amino acid sequence of the variable domains of two human IgM anti-gamma globuling [Lay/Pom) with shared idiotypic specificities."; Scand. New humanised anti-CD11a antibody - used in immunoassays for CD11a, and also to treat conditions such as immunological or inflammatory disease.

Claim 9; Page 48; 66pp; English.

The present sequence represents the light chain variable region of a humanised anti-CD11a antibody that binds specifically to the human CD11a fonain (WEM24 epitope). CD11a refers to the alpha subunit of lymphocyte function-associated antigen 1 (LFA-1) from any mammal. The humanised anti-CD11a antibodies are used to determine presence of CD11a in usual immunoassays or by in vivo imaging, particularly for diagnosis of CD11a-sasociated diseases (typically immune responses and inflammation such as psoriasis, Crohn's disease, rheumatoid arthritis, transplant rejection,

```
This sequence represents the light chain of the humanised antibody MFM24, and was used to produce a mutant of the invention. The mutants are of a species-dependent antibody (Ab), and have an amino acid substitution in a variable region of the Ab, and binding affinity for an antigen (Ag) from a non-human mammal at least 10 times stronger than for the wild type Ab against the Ag. The mutant antibodies are particularly intended for administration to a non-human mammal in precilinical studies (e.g. of infection, immunity, haematopoiesis or transplantation). They can also be used diagnostically (to identify specific proteins) or therapeutically, e.g. where directed against Colla (lymphocyte function-associated antigen). Or intercellular adhesion molecule-1 against a wide variety of inflammatory or autoimmune diseases, malignancies, transplant rejection, human immune deficiency virus infection and tumour cell invasion.

C conversion to the mutant form allows useful antibodies to be produced from antibodies which normally have affinity for non-human analogues of the Ag too low to be of any use
                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibody mutant production; species-dependent antibody; malignancy; infection; haematopolesis; lymphocyte function-associated antigen-1; intercellular adhesion molecule-1; inflammatory disease; CDlla; therapy; autoimmune disease; transplant rejection; tumour cell invasion; human immune deficiency virus infection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mutants of species-dependent antibodies with affinity for non-human mammalian antigon - greater than for parent antibody, particularly used for pre-clinical trial(s) in rhesus monkey(s) of therapeutic antibodies directed against CD1a.

The present invention describes a humanised anti-CD11a antibody (Ab) that binds specifically to the human CD11a I-domain. The Ab has anti-inflammatory, immunosuppressant, antitumour and antiviral activities. The Ab blocks lymphocyte function-associated with inflammatory hich is involved in leucocyte adhesion associated with inflammatory and immunological responses. The Ab are used: (1) optionally when coupled to a cytotoxin, to treat or prevent disorders mediated by lymphocyte function-associated antigen-1 (IrA-1; CD11a/CD18), e.g. psoriasis, inflammatory bowel disease, eczema, systemic lupus erythematosus, rinilammatory bowel disease, eczema, systemic lupus erythematosus, rinilammatory bowel disease, eczema, systemic lupus erythematosus, rinilammatory bowel disease, eczema, systemic lupus erythematosus, rinilamatory bowel disease, eczema, systemic lupus erythematosus, rinilamatory bowel disease, eczema, systemic lupus erythematosus, of undour pretreatment; (1) when labeled, to detect CD11a; (11) for unmour pretreatment; (11) when labeled, to detect CD11a; (11) for catain about the same activity in adhesion and mixed lymphocyte response sasys as the murine antibody winka for preventing adhesion between Jurkat cells (expressing LFA-1) and normal epidermal cantiocytes that express ICO 0.09 nM for preventing adhesion between Jurkat cells (expressing LFA-1) and normal epidermal canting the humanised version of MHM-1 (intracellula antibody humanised version of MHM-1 (intracellula antibody entry erity with the humanised antiperson entry erity and variable region of the humanised antiperson entry ent

(CD) Its antibody having specificity to human CD11a I-domain or CD11a with a ked value of not more than 1x10-8 M, or concentration for 50 % inhibition (ICSO) (aM) value of not more than 1 nM in mixed lymphocyte response assay or for preventing adhesion of Jurkat cells to normal human epidermal keratinocytes expressing intercellular adhesion molecule (ICAM)—I. Also included are a kit comprising the antibody and instructions for use to detect the CD11a protein, an isolated nucleic acid encoding the antibody, a vector comprising the nucleic acid, a host cell comprising the vector and producing the antibody by culturing the cell so that the antibody is expressed. The antibody by culturing the cell so that the antibody is useful for determining the presence of CD11a protein and for treating lymphocyte function-associated antigen 1 mediated disorder such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mouse; CD11a; I-domain; monoclonal antibody; light chain variable region; VL; cluster of differentiation 11a; mixed lymphocyte response assay; Jurkat cell; epidermal keratinocyte; intercellular adhesion molecule; ICAM-1; lymphocyte function-associated antigen I mediated disorder; psoriasis; Crohn's disease; ulcerative colitis; dermatitis; asthma; rheumatoid arthritis; systemic lupus erythematosus; multiple sclerosis; diabetes mellitus; prodrug activating enzyme; humanised.

as psoriasis, Crohn's disease, ulcerative colitis, dermatitis, asthma, rheumatoid arthritis, systemic lupus erythematosus, multiple sclerosis and diabetes mellitus. The antibody is useful when conjugated to a prodrug activating enzyme, or as an affinity purification agent. The present sequence is the light chain variable region (VL) of the humanised mouse anti-CD11a I domain monoclonal antibody MHM24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cDlla antibody; human immunodeficiency virus infection; HIV infection; rhinovirus infection; inflammatory skin disease; psoriasis; inflammatory bowel disease; Crohn's disease; psoriasis; adult respiratory distress syndrome; allergic disease; eczema; asthma; autoimmune disease; rheumatoid arthritis; systemic lupus erythematosus; SLE; diabetes mellitus; Reynaud's syndrome; immunological disease; tuberculosis; sarcoidosis; polymyositis; opp, CNS inflammatory disease; chronic obstructive pulmonary disease; COPD; CNS inflammatory disorder; skin hypersensitivity disorder; poison ivy; poison oak; B-cell malignancy; chronic lymphocytic leukaemia; hairy cell leukaemia; graft versus host disease; cancer; gene therapy; murine anti-human CDlla monoclonal antibody; MHM24; variable light chain; murine anti-human CDlla monoclonal antibody; MHM24; variable light chain;

for treating and preventing infectious diseases such as human immundeficiency virus (HIV) and rhinovirus infections, inflammatory skin disease such as psoriasis, inflammatory bowel disease such as Crohn's disease and ulcerative colitis, adult respiratory distress syndrome, a llergic diseases such as eczema and asthma, autoimmune diseases such as rheurits, systemic lupus erythematosus (SLB), diabetes mellitus, Reynaud's syndrome, immunological diseases such as mellitus, Raynaud's inflammatory disorder, skin hypersensitivity disease (COPD), CNS inflammatory disorder, skin hypersensitivity disorders such as poison ivy and poison oak, B-cell malignancies such as chronic lymphocytic leukaemia and hairy cell leukaemia, graft versus host disease and cancer. The invention is also useful in gene therapy. The present sequence is humanised murine anti-human CD11a monoclonal antibody (MHM24) F(ab)-8 variable light chain protein. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

```
The invention relates to a method of purifying a protein which comprises a CH2/CH3 region by protein A affinity chromatography. The method involves reducing the temperature of a composition comprising the protein and one or more impurities subjected to protein A affinity chromatography to 3-20 degrees Celsius, where protein A leaching is reduced. Preferably the protein is antibody. The antibody is selected from Trastuzumab, the manized CD11a antibody, and humanized VEGF antibody. Preferably, the antibody binds HER2 antigen, where the antibody is Trastuzumab or humanized 2C4. The protein is an immunoadhesin, specifically a TNP receptor immunoadhesin. The methods are useful for specifically a TNP receptor immunoadhesin. The methods are useful for specifically chromatography and for reducing leaching of protein A affinity chromatography. The current sequence represents the variable light chain amino acid sequence of CD11a.

The present invention relates to a recombinant monoclonal antibody for human CD11a has the amino acid sequence shown by SEQ ID No.1 or SEQ ID No.5 in 1ight-chain variable region and the amino acid sequence shown by SEQ ID No.2 or SEQ ID No.6 in heavy-chain variable region. Its bloactivity and the expression in host cell are greatly increased. The DNA molecule for coding the antibody, its preparation process and the medicinal composition containing it are also disclosed. The present sequence represents a light chain variable region of human CD11a.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mixture containing a host cell protein. This method comprises subjecting the mixture containing a host cell protein. This method comprises subjecting the mixture to a non-affinity purification followed by high-performance cangential flow filtration (HPTPP) and isolating the protein in a purity containing less than 100 parts/million (ppm) of the host cell protein, where the method of the invention is useful for purifying a target protein from a mixture containing a host cell protein, and is useful for incorporating the isolated protein into a pharmaceutical formulation. Containing the method of the invention are useful in a pharmaceutic purposes. The method of the invention is efficient in purifying a target protein from a mixture containing a host cell protein, cand may also be effectively performed at low cost. The current sequence represents the anti-Chila rhuwab light chain amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
The invention relates to a method for purifying a target protein from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Purifying target protein from mixture containing host cell protein involves subjecting mixture to non-affinity purification, high-performance tangential flow filtration and isolating purified protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

conjugates of nonproteinaceous polymers with antibody fragments, used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antibody fragments covalently attached to one or more nonproteinaceous polymer molecules, where the apparent size of the conjugate is at least about 500 kDa. Conjugates of antibody fragments which blind the human interleukin (IL) 8 with a nonproteinaceous polymer can be used for treating inflammatory disorders e.g. acute lung injury, ischaemic treating inflammatory disorders e.g. acute lung injury, ischaemic treating e.g. inflammatory skin diseases including psoriasis and atopic dermatitis, systemic scleroderma and sclerosis, and asthmatic diseases. The conjugates can also be used as reagents in an animal model system for in vivo study of the biological functions of the antigen recognised by the conjugate. The present sequence represents the human light chain kappa-I consensus framework from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 DIQMIQSPSSLSASVGDRVIITCRASKIISKYLAWYQQKPGKAPKILIYYSGSTLESGVP 60

                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an anti-interleukin-8 (IL-8) monoclonal antibody (MAb). The anti-IL-8 MAb comprises a sequence containing the CDRs (complementarity determining regions) of the humanized anti-IL-8 64-2.5VINN35A light chain, and amino acids 24-253 of the humanized anti-IL-8 664.2.5VINN35A heavy chain. The anti-IL-8 MAbs and fragments can be used in diagnosis, for affinity purification of IL-8 from recombinant cell culture or natural sources and for the treatment of inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Humanised antibody; anti-IL-8; interleukin-8; inflammation; septic shock;

The invention relates to treating acute lung injury in a mammal, comprising administering to the mammal an effective amount of a conjugate copy and antibody fragment covalently attached to 1 or 2 polyethylene cylycol (FBG) molecules, where the antibody fragment is a F(ab') 2 comprising: (a) first chain that is either a light chain or a heavy chain opposite the first hight chain or a light chain opposite the first heavy chain; (C) a second chain that is either a heavy chain; and (d) a second chain that is either a heavy chain; and (d) a second chain that is either a heavy chain; where every EBG molecule is covalently attached to a first cysteine residue in the first con second chain that would ordinarily form a disulphide bridge with a second cysteine residue in the first or second opposite chain, where the second cysteine residue in the first or second opposite bridge is avoided by substitution of another amino acid cresidue for the second cysteine residue in the first or second opposite chain, where the F(ab') 2 comprises an antigen binding site that binds to human interleukin-8 (IL-8), and where the apparent size of the conjugate chain, where the F(ab') 2, and where the apparent size of the conjugate conjugate in a mammal and inflammatory diseases syndrome murine monoclonal antibodies 5.12.14 or 642.5. The method is useful for treating lung injury, including adult respiratory distress syndrome conformatory bowel disease, psoriasis and sclerosis, meningtis, consensed and disorders isted in the specification. The present sequence conforms and disorders listed in the specification. The present sequence is represente a human antibody a sequence fibrored arthritis, and where the specification. The present sequence is the comparison with the monoclous has a sequence in the sequence is the specification. The present sequence
                                                                                                                                                                                                                                                                                                Treating acute lung injury in mammal by administering to mammal a 500 kD conjugate comprising P(ab') 2 antibody fragment that binds to human interleukin-8, covalently attached to one or two polyethylene glycol

Treating inflammatory disorder in a mammal, involves administering a conjugate of polyethylene glycol and a single antibody fragment comprising antigen binding site that binds to human interleukin-8, to

Example 3G; Fig 29; 259pp; English.

The invention relates to treating an inflammatory disorder in a mammal, comprising administering to the mammal, an effective amount of a conjugate of a single antibody fragment (e.g. the heavy or light chains of the humanised mouse monoclonal antibodies 5.12.14 and 664.2.5, which also have their intramolecular disulphide bridges ablated by substitution mutations covalently attached to one or two polyethylene glycol (PBG) molecules. The antibodies comprise an antigen binding site that binds to human interleukin-8 (IL-8), and the apparent size of the conjugate is at least 500 kbs. The method is useful for treating an inflammatory disorder e.g. ischaemic reperfusion disorder such as surgical tissue reperfusion injury, myocardial ischaemia or myocardial infarction, or hypovolemic shock, in a mammal e.g. human. The method is useful for treating injury, myocardial ischaemia or myocardial infarction, or hypovolemic shock, in a mammal e.g. human. The method is useful for treating calcroderma and sclerosis, responses associated with inflammatory bowel disease, ischaemic reperfusion disorders, myocardial ischaemic conditions, cerebral codema secondary to stroke, cranial trauma, asphyria, adult respiratory distress syndrome, caute-lung injury, Behcet's disease, dermatomycostis, polymyositis, multiple sclerosis, dermatitis, encephalitis, polymyositis, multiple sclerosis, cantible organ injury syndrome secondary to septicaemia or trauma, alcoholic hepsitis, bacterial pneumonia, antigenential premumania, antigenential premumania, antigenential pneumonia, antigenential premumania, antigenenti mediated diseases including glomerulonephritis, sepsis, sarcoidosis, immunopathologic responses to tissue/organ transplantation, inflammations of the lung, inflammatory bowel disease such as ulcerative colitis and asthma. The present sequence represents the light or heavy chain of human 1gG, used to design the humanising mutations in the two mouse antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel conjugates comprising antibody fragments covalently attached to nomproteinaceous polymer molecules. The invention is useful for treating interleukin (IL) a mediated diseases or disorders such as inflammatory diseases, acute lung injury e.g. adult respiratory distress syndrome (ARDS), ischaemic reperfusion injury e.g. myocardial infarction, hypoolemic shock, inflammatory bowel disease e.g. uncertained colitis, bacterial pneumonia and asthma. The invention is also useful as a reagent in an animal model system for in vivo study of the biological succious of the antigen recognised by the conjugate. The present sequence is used in the exemplification of the invention

This interaction describes a movel, vaccine (VI) and/or an antibody, or comprising DNA (1) and/or an antibody, or completely imitates CDA, is new. (1) encodes a region of an antidotypic antibody (Ab2) or another peptide which: (a) specifically binds to the binding site of an antibody (Ab1) or an antigon of peptide which is an antigon of specifically binds to the binding site of an antibody (Ab1) or an antigon binding molecule; and (b) immunologically mimics the initial antigen. The binding molecule; and (b) immunologically mimics the initial antigen. The products is partially or completely conformation-dependent, and has an immunogenic structure defined by a specific spatial conformation of adds. (I) is used in the form of linear or dirular naked DNA and/or atth a viral vector and/or adjuvants. The products of the invention have cytostatic, virucidal, antibacterial and antiparasitic. The invention also describes (1) a corresponding vaccine (V2) against antigens which are not proteins or peptides, as defined above but which have epitopes which have an immunogenic structure; (2) preparing (V1) and (V2); (3) than antidiotypic antibody fragments against the MUC1-conformation epitope having one of 31 approximately 60 residue amino acids sequences, all fully defined in the specification; (4) MUC1-conformation epitope mimics having one of 16 9-17 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics thating one of 25 7-13 residue amino acid sequences, all fully defined in the specification; (6) TF carbohydrate epitope mimetics the specification; and (7) DNA sequences encoding the fragments and cancer, and infectious diseases, a cancer, and infectious diseases, cancer, and infectious diseases.
                                                                                                                                                                                                                                                                                                          MUC1; human; vaccine; conformation-dependent antigen; antibody; cancer; antidiotypic antibody; cytostatic; virucidal; antibacterial; TF antigen; antiparasitic; infectious disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccines against conformation-dependent or non-peptide antigens, based on 
DNA encoding peptide which mimics the antigen, useful e.g. as antitumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel vaccine (V1) against conformation-
